(1959-1960) Inis Beag

fishing season, will not use up so much time getting to and from the pastures. Other reasons for shifting cows are that the village wells are more dependable than the springs at the back of the island during occassional summer dry spells, and cows when "tormented" by insects can run about the terrace fields more safely than they can the rockier and more fissured indigenous and improved plots above. Milking is done between eight thirty and ten o'clock in the morning and four thirty and six in the afternoon during the winter, and an hour or two later in the summer. When milking, the farmer crouches at the right side of the beast and holds a pail with his left hand while drawing one teat at a time with his right. He murmurs to the cow in Irish to keep it pacified, and is ready to move swiftly should the animal suddenly shift its position.

To encourage cattle breeding, the government subsidizes the construction of reservoirs at the back of the island for collecting rain water, and of barns and outbuildings for storing hay, rye, potatoes, and farming and fishing equipment. The typical reservoir is placed in an area surrounded by actual or potential grazing land located at a considerable distance from the nearest spring. It is composed of a cemented stone platform with a slanting concave surface which drains into a rectangular shaped tank. Barns and outbuildings are small stone structures, usually thatched, which are single roomed and doored and may have one or two small windows. The barns, like the reservoirs, are placed within easy access of fields used for pasturage.

Sheep are reared in Inis Beag to furnish wool, as well as to be sold and slaughtered for local consumption. They demand little care, as they are allowed to graze in undeveloped pastures and to obtain water from rain filled depressions in the pavement and from plants that they devour. Kept by their owners for five or six years and then disposed of, they are sheared once a year between May and July. There are white, brown, and black haired varieties, and between six and eight pounds of wool can be procured from an animal every shearing. If a householder possesses a large herd, he may choose to sell some of his lambs when they are six months old, and in August many lambs are shipped from Inis Beag on the steamer. Although some folk from time to time slaughter their own sheep to provide meat for the tables, several householders maintain large herds and specialize in selling lamb and mutton to visitors and fellow islanders.

All Inis Beag homes have at least one dog and most of them have a cat. These animals perform certain services and act as pets. At the time walls were low at the back of the island, dogs were employed to round up sheep, and they also aided their owners hunt rabbits along the rock piled shore of the west sound, when the meat of this animal was eaten more commonly than it is today. Now, their duties are restricted to warning of the approach of strangers and chasing chickens out of the kitchen. Cats are kept to catch mice, and their presence on the premises is sufficient to keep rats from approaching the house and outbuildings. They are treated less well than dogs, but both dogs and cats are given little affection and often are not fed enough. It is true that some islanders are strongly attached to their pets and provide them with adequate care, but they are the exceptions. A man devoted to his dog will be followed about the island by the animal, and a desired trait in a dog is that it will not show interest in persons outside of the
